

Inheritance Basics

S.Ducasse, L. Fabresse, G. Polito, and P. Tesone

Goal

- What is inheritance?
- When to use it?
- BTW, Pharo has the same inheritance model as Java

Inheritance

- It is a reuse mechanism
 - We do not reimplement the code of the superclasses
 - We extend it or customize it
- It is based on the expression of a delta
 - Only specify the differences to the superclasses

The basics

Needs:

- We want to adapt the code by extending existing behavior and state
- We do not want to reimplement everything

Solution: **class inheritance**

- A class extends the definition of its superclass

Basic subclass behavior

A subclass:

- can **add** state and behavior: color, borderColor, ...
- can **use** superclass behavior and state
- can **redefine** superclass' behavior to **specialize** it

Root of inheritance hierarchy

- Object is the root of most classes
 - defines the common behavior of all objects
 - raising errors, class access, ...

In Pharos: ProtoObject

ProtoObject (Object's superclass) has a special purpose:

- raising as much errors as possible
- so that the system can catch such errors and do something with them
- useful for building advanced techniques such as proxy objects

Two aspects of inheritance

Inheritance is:

- **static** for state/instance variables (i.e., during class creation)
- **dynamic** for behavior (i.e., during execution)

Inheritance of instance variables

- Happens during **class definition**
- Computed from
 - the class own instance variables
 - the ones of its superclasses
 - usually no duplicate in the chain
- ColoredRectangle **has** a width, height, color, and borderColor

Inheritance of behavior

- Happens at **run time**
- The method is looked up
 - starting from the receiver's class
 - then going along superclasses

What you should know

- Inheritance allows developers of a class to **add** state and behavior and **redefine** behavior
- A class has 1 and only 1 superclass (single inheritance model)
- A class eventually inherits from `Object`
- Inheritance of state is static
- Inheritance of behavior is dynamic
